

Hi Alex,

Please see below summary of the job:

The job is QA tester which involves verification of the new firmware and configurator software to confirm proper operation of our FlexNet network fire alarm system. This will require checking of recent changes against performance specifications as well as regression testing of the equipment against a prescribed regression test plan to ensure that the recent changes do not affect existing functionality. Some of the testing will require the proposal and assembly of new test set ups. All testing will be documented in our bug tracking program – Bugzilla.

Please let me know if you require any additional details.

Thank you,

Mariam Ishmael
Human Resources Generalist
[Mircom Group of Companies](#)
